

Business Recommendations

Candidate ranking for “aspiring human resources” and “seeking human resources”

Recommendation

Use a two-stage ranking workflow: transparent relevance rules first, then Word2Vec semantic ranking, with recruiter stars used to personalize the shortlist. Word2Vec is a pretrained language model that recognizes similarity in meaning between job titles and recruiter searches, even when wording differs.

0.892 / 1.000

Overall ranking quality

NDCG@10 checks whether the best candidates appear near the top; 1.0 is ideal.

≈ #2

Typical starred position

At the selected 30% feedback weight.

9 / 10

Top candidates retained

Personalizes results without rebuilding the shortlist from scratch.

What recruiter feedback actually changed

Seeking-HR example after starring an ideal HR candidate

Starring ID 99 for the seeking-HR search moved the ideal candidate from rank 8 to rank 1. The effect was not limited to the starred profile: ID 100, another relevant HR candidate, rose from rank 15 to rank 9, while ID 92, a non-HR candidate seeking Customer Service or Patient Care work, fell from rank 10 to rank 15. NDCG@10 improved from 0.826 to 0.904.

This is significant because the feedback mechanism improved the surrounding ordering rather than simply forcing one candidate to the top. It pulled another relevant HR profile into the top 10 and pushed an obvious false positive out. At the selected 30% feedback weight, the broader tests retained 9 of the original top 10 candidates in the typical scenario, so recruiters can personalize results without rebuilding the shortlist from scratch.

Recommended business workflow

1

Screen obvious mismatches

Rules flag profiles with no defensible role relevance.

2

Prioritize plausible candidates

Word2Vec ranks candidates by semantic fit to the recruiter search.

3

Personalize with a star

Use 70% original query + 30% starred-candidate influence.

Business impact

Reduce manual screening, surface stronger candidates earlier, keep recruiter control, and make obvious exclusions more explainable. Avoid a universal similarity cutoff; use rules to flag obvious non-matches and semantic ranking to prioritize the rest.

Rules protect relevance • Word2Vec prioritizes • Recruiter feedback personalizes

Recommended next step: pilot with recruiters and track shortlist acceptance, false positives, and review time.
